

CSN 2022 Site Report: Fresno - Garland (CA)

AQS ID: 06-019-0011, POC 5 (36.785322, -119.774174) 1-in-3 Day Schedule

The Chemical Speciation Network (CSN) is a routine air monitoring network designed to complement the PM_{2.5} monitoring network; support the implementation of PM_{2.5} National Ambient Air Quality Standards (NAAQS); assist in developing and tracking emission control strategies; and provide data to aid in health studies. CSN sites are primarily located in urban areas and complement the largely rural Interagency Monitoring of PROtected Visual Environments (IMPROVE) network. The CSN target analytes are trace elements, ions, and carbon.

Percent of Samples Successfully Collected and Analyzed Per Year

2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
93	97	95	93	95	97	92	98	100	87	91

Samples Successfully Collected and Analyzed in 2022 by Filter Type. PTFE: 113 (90.4%), Nylon: 113 (90.4%), Quartz: 116 (92.8%)

The plots below show temporal trends for site 06-019-0011 alongside network-wide CSN and IMPROVE average concentrations. The top plot shows the variability of the reconstructed fine mass (RFM) concentrations during 2022; RFM can only be calculated if all three filters collected on a sampling day are valid. The bottom plot illustrates the long-term trends of ambient concentrations; the gray shaded region represents the range of values measured each year at this site, illustrated using the 10th and 90th percentile values.

Daily Reconstructed Fine Mass in 2022

Long-Term Trends in Reconstructed Fine Mass

Missing years are due to low number of RFM values.

The following plots summarize the chemical composition of particles collected at this site. The monthly averaged compositions calculated from 2018-2022 data are shown on the left while compositions for the day with the highest measured concentrations during 2022 are shown on the right.

Components	Calculation	Natural Sources	Anthropogenic Sources
Salt	$1.8 \cdot \text{Chloride}$	Ocean spray, dry lakebeds	Chemical manufacturing, lake consumption
Soil Dust	$2.2 \cdot \text{Al} + 2.49 \cdot \text{Si} + 1.63 \cdot \text{Ca} + 2.42 \cdot \text{Fe} + 1.94 \cdot \text{Ti}$	Soil resuspension, dust storms long-range transport	Construction, agriculture, deforestation, unpaved roads
Soot	Elemental Carbon	Wildfires	Motor vehicles, wood burning, smoking
Organic Matter	$1.4 \cdot \text{Organic Carbon}$	Plants, animals, wildfires	Motor vehicles, cooking oils, household cleaners
Nitrate	$1.29 \cdot \text{Nitrate}$	Plants, animals	Fertilizer, stock yards, chemical manufacturing
Sulfate	$4.125 \cdot \text{Sulfur}$	Volcanism	Coal-fired power plants, chemical manufacturing

The following map shows the average RFM concentrations for nearby sites in both CSN and the rural IMPROVE Network. The point shapes indicate which network the sites are associated with. The color bar indicates the average annual RFM concentration (micrograms per cubic meter) measured at each site in 2022.
