CSN 2020 Site Report: Philadelphia - Ritner

AQS ID: 42-101-0055, POC 5 (39.922867, -75.186921) 1-in-6 Day Schedule

The Chemical Speciation Network (CSN) is a routine air monitoring network designed to complement the PM$_{2.5}$ monitoring network; support the implementation of PM$_{2.5}$ National Ambient Air Quality Standards (NAAQS); assist in developing and tracking emission control strategies; and provide data to aid in health studies. CSN sites are primarily located in urban areas and complement the largely rural Interagency Monitoring of PROtected Visual Environments (IMPROVE) network. The CSN target analytes are trace elements, ions, and carbon.

Percent of Samples Successfully Collected and Analyzed Per Year

Samples Successfully Collected and Analyzed in 2020 by Filter Type. PTFE: 61 (100%), Nylon: 61 (100%), Quartz: 55 (90.2%)

The plots below show temporal trends for site 42-101-0055 alongside network-wide CSN and IMPROVE average concentrations. The top plot shows the variability of the reconstructed fine mass (RFM) concentrations during 2020; RFM can only be calculated if all three filters collected on a sampling day are valid. The bottom plot illustrates the long-term trends of ambient concentrations; the gray shaded region represents the range of values measured each year at this site, illustrated using the 10th and 90th percentile values.

Daily Reconstructed Fine Mass in 2020

Long–Term Trends in Reconstructed Fine Mass

Missing years are due to low number of RFM values.

The following plots summarize the chemical composition of particles collected at this site. The monthly averaged compositions calculated from 2016-2020 data are shown on the left while compositions for the day with the highest measured concentrations during 2020 are shown on the right.

### Average Monthly Particle Composition

![Graph showing average monthly particle composition with bars for each month, colored by component type: salt, soil.dust, soot, organic.matter, nitrate, sulfate.]

### Highest Day

![Graph showing the highest day particle composition with bars for each month, colored by component type: salt, soil.dust, soot, organic.matter, nitrate, sulfate.]

**Components**
- **Salt**
  - Calculation: $1.8 \cdot Chloride$
  - Natural Sources: Ocean spray, dry lakebeds
  - Anthropogenic Sources: Chemical manufacturing, lake consumption
- **Soil Dust**
  - Calculation: $2.2 \cdot Al + 2.49 \cdot Si + 1.63 \cdot Ca + 2.42 \cdot Fe + 1.94 \cdot Ti$
  - Natural Sources: Soil resuspension, dust storms, long-range transport
  - Anthropogenic Sources: Construction, agriculture, deforestation, unpaved roads
- **Soot**
  - Calculation: $Elemental Carbon$
  - Natural Sources: Wildfires
  - Anthropogenic Sources: Motor vehicles, wood burning, smoking
- **Organic Matter**
  - Calculation: $1.4 \cdot Organic \ Carbon$
  - Natural Sources: Plants, animals, wildfires
  - Anthropogenic Sources: Motor vehicles, cooking oils, household cleaners
- **Nitrate**
  - Calculation: $1.29 \cdot Nitrate$
  - Natural Sources: Plants, animals
  - Anthropogenic Sources: Fertilizer, stock yards, chemical manufacturing
- **Sulfate**
  - Calculation: $4.125 \cdot Sulfur$
  - Natural Sources: Volcanism
  - Anthropogenic Sources: Coal-fired power plants, chemical manufacturing

The following map shows the average RFM concentrations for nearby sites in both CSN and the rural IMPROVE Network. The point shapes indicate which network the sites are associated with. The color bar indicates the average annual RFM concentration (micrograms per cubic meter) measured at each site in 2020.

![Map showing the average RFM concentrations for sites in both CSN and the rural IMPROVE Network with point shapes indicating network association. The color bar indicates the concentration levels ranging from 4 to 10 micrograms per cubic meter.]
